A FINAL YEAR PROJECT REPORT
SUBMITTED IN PARTIAL FULFILLMENT OF THE
REQUIREMENTS FOR THE DEGREE OF BACHELOR OF
INFORMATION ENGINEERING DEPARTMENT OF
INFORMATION ENGINEERING
THE CHINESE UNIVERSITY OF HONG KONG

I. Work done in the past week

We are finally done with the search function and it's working perfectly now. We also started to look into the chat function and try to simulate how a "chat" actually works. To simulate it, we created a JSON named "chatter", which had a basic structure of how chats were stored and retrieved.

II. Challenges / problems faced

We spent some time finding a package that looks great and suitable for us to use and deploy for our "chatter" function. We also had some trouble with the JSON formats since we need to set a schema for the data we are going to store in the DB and the JSON we wanted seems to be not working. But we get it finally.

III. Tasks planned to be done in the coming week

Finish up the "chatter" and try to have our first message sent out!
